

# Android Pentest: Automated Analysis using MobSF

February 24, 2021 By Raj Chandel

## Introduction

MobSF is an open-source tool developed by Ajin Abraham that is used for automated analysis of an APK. This is a collection of tools that run under one interface, perform their own individual tasks (like Jadx, apktool etc) and display their results under a common interface. These reports can be downloaded in a PDF format too and give out detailed analysis with necessary screenshots as well. You can download MobSF [here](#). In this article, we'll be walking through the installation phase in Ubuntu OS and guiding you through various options that this tool has to offer.

## Table of Content

- Installation
- Landing Page
- Signer Certificate Analysis
- Application Permissions
- Browsable Activities & Network Security Analysis
- Manifest Analysis
- Code Analysis
- Related to Malware Analysis
- Hardcoded secrets
- Activity Components Present
- Files Present in APK Packages
- Dynamic Analyzer
- Logcat Stream
- API Monitor
- Downloading Reports

Let's begin!

## Installation

To install MobSF, create a directory and follow the commands:

```
git clone https://github.com/MobSF/Mobile-Security-Framework-MobSF.git
cd Mobile-Security-Framework-MobSF
```

```

root@hex:/home/hex/android-toolkit# git clone https://github.com/MobSF/Mobile-Security-Framework-MobSF.git
Cloning into 'Mobile-Security-Framework-MobSF'...
remote: Enumerating objects: 3, done.
remote: Counting objects: 100% (3/3), done.
remote: Compressing objects: 100% (3/3), done.
remote: Total 16859 (delta 0), reused 1 (delta 0), pack-reused 16856
Receiving objects: 100% (16859/16859), 1.09 GiB | 7.64 MiB/s, done.
Resolving deltas: 100% (8022/8022), done.
root@hex:/home/hex/android-toolkit# cd Mobile-Security-Framework-MobSF/
root@hex:/home/hex/android-toolkit/Mobile-Security-Framework-MobSF#

```

We need to install dependencies before we are able to run:

```

apt-get install python3-venv
pip3 install -r requirements.txt

```

```

root@hex:/home/hex/android-toolkit/Mobile-Security-Framework-MobSF# apt-get install python3-venv
Reading package lists... Done
Building dependency tree
Reading state information... Done
python3-venv is already the newest version (3.8.2-0ubuntu2).
0 upgraded, 0 newly installed, 0 to remove and 0 not upgraded.
root@hex:/home/hex/android-toolkit/Mobile-Security-Framework-MobSF# pip3 install -r requirements.txt
Ignoring waitress: markers 'platform_system == "Windows"' don't match your environment
Requirement already satisfied: Django>=3.1.5 in /usr/local/lib/python3.8/dist-packages (from -r requirements.txt (line 1)) (3.1.7)
Requirement already satisfied: lxml>=4.6.2 in /usr/local/lib/python3.8/dist-packages (from -r requirements.txt (line 2)) (4.6.2)

```

Once done, we can run the setup file to install MobSF and all the components automatically

```
./setup.sh
```

```

root@hex:/home/hex/android-toolkit/Mobile-Security-Framework-MobSF# ./setup.sh
[INSTALL] Found Python 3.8.5
pip 21.0.1 from /root/.local/lib/python3.8/site-packages/pip (python 3.8)
[INSTALL] Found pip
Requirement already satisfied: pip in /root/.local/lib/python3.8/site-packages (21.0.1)
[INSTALL] Using python virtualenv

```

Now, to run MobSF we execute the **run.sh** file. As one could interpret from the screenshot below that MobSF would be running on a local server on port 8000.

```

root@hex:/home/hex/android-toolkit/Mobile-Security-Framework-MobSF# ./run.sh
[2021-02-22 21:15:01 +0530] [15422] [INFO] Starting gunicorn 20.0.4
[2021-02-22 21:15:01 +0530] [15422] [INFO] Listening at: http://0.0.0.0:8000 (15422)
[2021-02-22 21:15:01 +0530] [15422] [INFO] Using worker: threads
[2021-02-22 21:15:01 +0530] [15424] [INFO] Booting worker with pid: 15424

```

Now let's open the link in the browser and see if MobSF was installed properly or not.

## Landing Page

Now that the MobSF is up and running, we can drag a dummy APK (in this case, I'll take InjuredAndroid by Kyle Benac ([here](#))) into the MobSF interface and see what happens. After waiting for a couple of minutes we could see that static analysis of the APK is done. Now here on the landing page, we can see that a severity score is given. The higher this score the more secure app is. Next, hashes, filename and size of the APK are also given. In the third column in the first row, we can also see the package name, main activity, min SDK version and the application version as well. The description of the application is also given.

The screenshot displays the Static Analyzer web interface. The browser address bar shows the URL: 0.0.0.0:8000/static\_analyzer/?name=InjuredAndroid-1.0.10-release.apk&ch. The interface has a blue header with navigation links: RECENT SCANS, STATIC ANALYZER, DYNAMIC ANALYZER, API DOCS, and ABOUT. A search bar labeled 'Search MD5' is also present.

The main content area is divided into four sections:

- APP SCORES:** Features a green Android icon with 'B3NAC SEC' text. It shows an 'Average CVSS' of 7.0, a 'Security Score' of 70/100, and 'Trackers Detection' of 0/343.
- FILE INFORMATION:** Lists details for the file 'InjuredAndroid-1.0.10-release.apk':
  - Size: 17.49MB
  - MD5: c7c91424ab41179ead7186cf586c8a3d
  - SHA1: 47d86e733821cec0cbb5dae8eab68eddddef0de10
  - SHA256: 5e111b2bdcd9c9550737ec468bd30ddfb6e4af40bf61a573c775a27d61eae02
- APP INFORMATION:** Lists app details:
  - App Name: InjuredAndroid
  - Package Name: b3nac.injuredandroid
  - Main Activity: b3nac.injuredandroid.MainActivity
  - Target SDK: 29, Min SDK: 21, Max SDK: 29
  - Android Version Name: 1.0.9
  - Android Version Code: 17
- PLAYSTORE INFORMATION:** Lists playstore details:
  - Title: InjuredAndroid
  - Score: 0.0, Installs: 100+, Price: 0
  - Android Version Support: 5.0 and up
  - Category: Education
  - Play Store URL: b3nac.injuredandroid
  - Developer: B3nac, Developer ID: B3nac
  - Developer Address: None
  - Developer Website: https://b3nac.com/
  - Developer Email: b3nac.sec@gmail.com
  - Release Date: Jul 20, 2020
  - Privacy Policy: Privacy link
  - Description:
    - Setup for a physical device
    - 1. Download the latest release from Google Play.
    - Setup for an Android Emulator using Android Studio
    - 1. Pull the apk from a physical device after installing from Google Play with adb pull.

After scrolling down a little bit, here's what all we can see:

- In small cards, we see different application components
- Dynamic analysis option that will help MobSF conduct run time analyses
- Option to view decompiled code. This is the code that is generated by apktool. Generally, the resources file would also be decoded. It is also possible to view smali code. It makes it easier to segregate and view source code in separate java classes using this.

The screenshot displays the Android Studio interface with the following components:

- Summary Cards:** Four colored cards at the top showing counts for Activities (30), Services (1), Receivers (1), and Providers (1). Each card has a 'View' button with a dropdown arrow.
- Exported Elements:** Below the summary cards are four white boxes showing the number of exported elements: Activities (8), Services (0), Receivers (1), and Providers (0).
- SCAN OPTIONS:** A section with two buttons: 'Rescan' (blue) and 'Start Dynamic Analysis' (green). A red arrow points to the 'Start Dynamic Analysis' button.
- DECOMPILED CODE:** A section with two rows of buttons. The first row contains 'View AndroidManifest.xml' (blue), 'View Source' (teal), and 'View Smali' (teal). A red arrow points to the 'View Smali' button. The second row contains 'Download Java Code' (yellow), 'Download Smali Code' (yellow), and 'Download APK' (yellow). A red arrow points to the 'Download APK' button.

## Signer Certificate Analysis

In the certificate column, we can see the signer certificate where one can find important information about the developer, country, state, type of algo, bit size etc.

## SIGNER CERTIFICATE

APK is signed  
v1 signature: True  
v2 signature: True  
v3 signature: False  
Found 1 unique certificates  
Subject: C=US, ST=CA, L=Sacramento, O=B3nac Sec, OU=B3nac Sec, CN=Kyle Benac

Search:

## Application Permissions

Further, we can see all the permissions an application has. There are various permissions that are categorized as dangerous or normal. It is important from a security analyst's point of view to understand which permissions can lead to further damage. For example, if an application has access to external media and stores critical information on the external media it could prove to be dangerous since the files stored on external media are globally readable and writable.

## APPLICATION PERMISSIONS

Search:

| PERMISSION                                | STATUS    | INFO   | DESCRIPTION  |
|---|-----------|--|--|
| android.permission.ACCESS_NETWORK_STATE   | normal    | view network status                          | Allows an application to view the status of all networks.  |
| android.permission.INTERNET               | normal    | full Internet access                         | Allows an application to create network sockets.   |
| android.permission.READ_EXTERNAL_STORAGE  | dangerous | read external storage contents               | Allows an application to read from external storage.   |
| android.permission.READ_PHONE_STATE       | dangerous | read phone state and identity                | Allows the application to access the phone features of the device. An application with this permission can determine the phone number and serial number of this phone, whether a call is active, the number that call is connected to and so on. |
| android.permission.WRITE_EXTERNAL_STORAGE | dangerous | read/modify/delete external storage contents | Allows an application to write to external storage.  |

## Browsable Activities & Network Security Analysis

Next, in the browsable activities section, we can see all the activities that have implemented a deep link schema. Please refer to the article [here](#) to understand all about deep links, its implementation as well as exploitation.

In the network security section, one can find some details about network security issues related to the application. These issues can lead to critical attacks like MiTM sometimes. For example, in the screenshot below, one can find that the application isn't using the SSL pinning mechanism implemented.

## BROWSABLE ACTIVITIES

Search:

| ACTIVITY <span>↑↓</span>               | INTENT <span>↑↓</span>   |
|--|--|
| b3nac.injuredandroid.CSPBypassActivity | <b>Schemes:</b> http://, https://,<br><b>Hosts:</b> b3nac.com,<br><b>Path Patterns:</b> /*/, |
| b3nac.injuredandroid.DeepLinkActivity  | <b>Schemes:</b> flag11://, https://,   |
| b3nac.injuredandroid.RCEActivity       | <b>Schemes:</b> flag13://,<br><b>Hosts:</b> rce,   |

## NETWORK SECURITY

Search:

| NO <span>↑↓</span> | SCOPE <span>↑↓</span> | SEVERITY <span>↑↓</span> | DESCRIPTION <span>↑↓</span>   |
|--------------------|-----------------------|--------------------------|---|
| 1                  | *                     | high                     | Base config is insecurely configured to permit clear text traffic to all domains. |

Showing 1 to 1 of 1 entries

Previous **1** Next

## Manifest Analysis

In the next section, MobSF has analysed the manifest file. One can find many folds of information from the android manifest file like which activities are exported, if the app debuggable or not, data schemas etc. For reference look at the screenshot below.

| NO ↑↓ | ISSUE ↑↓   | SEVERITY ↑↓ | DESCRIPTION ↑↓   |
|-------|--|-------------|--|
| 1     | App has a Network Security Configuration<br>[android:networkSecurityConfig=@xml/network_security_config] | Info        | The Network Security Configuration feature lets apps customize their network security settings in a safe, declarative configuration file without modifying app code. These settings can be configured for specific domains and for a specific app. |
| 2     | Application Data can be Backed up<br>[android:allowBackup] flag is missing.                              | medium      | The flag [android:allowBackup] should be set to false. By default it is set to true and allows anyone to backup your application data via adb. It allows users who have enabled USB debugging to copy application data off of the device.          |
| 3     | <b>Activity</b> (b3nac.injuredandroid.CSPBypassActivity) is not Protected.<br>An intent-filter exists.   | high        | An Activity is found to be shared with other apps on the device  |

www.hackingarticles.in

## Code Analysis

One of the most interesting features of the MobSF tool is the code analysis section. In this section, we can see that MobSF has analysed and compared some behaviour of the application based on industry security standard practices like OWASP MSTG and mapped the vulnerabilities with OWASP Top 10. It is interesting to see CWE mentioned and CVSS score being assigned here which might help various analyst scenarios and help the creation of reports way easier.

## </> CODE ANALYSIS

Search:

| NO  | ISSUE   | SEVERITY  | STANDARDS    | FILES    |
|--|--|--|---|---|
| 1  | App uses SQLite Database and execute raw SQL query. Untrusted user input in raw SQL queries can cause SQL Injection. Also sensitive information should be encrypted and written to the database. | high   | <b>CVSS V2:</b> 5.9 (medium)<br><b>CWE:</b> CWE-89 Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')<br><b>OWASP Top 10:</b> M7: Client Code Quality | b3nac/injuredandroid/f.java   |
| 2  | The App logs information. Sensitive information should never be logged.  | Info   | <b>CVSS V2:</b> 7.5 (high)<br><b>CWE:</b> CWE-532 Insertion of Sensitive Information into Log File<br><b>OWASP MASVS:</b> MSTG-STORAGE-3  | b/c/c/c.java<br>b3nac/injuredandroid/FlagFiveReceiver.java<br>b3nac/injuredandroid/k.java<br>a/i/b/c.java<br>b/c/a/a/b/d.java<br>b3nac/injuredandroid/AssemblyActivity.java<br>b/c/a/b/y/b.java<br>b/c/a/a/d/c/q1.java<br>a/g/e/g.java<br>io/flutter/view/c.java<br>a/g/j/b.java<br>b/c/a/b/n/a.java<br>a/g/d/d/b.java<br>c/a/a.java<br>a/g/l/b.java<br>a/a/n/g.java<br>... |

## Related to Malware Analysis

MobSF also hosts a section where an APKiD analysis is given. APKiD is an open-source tool that is very helpful to identify various packers, compilers, obfuscators etc in android files. It is analogous to PEiD in APK. Here one can see that it has detected an anti-vm code in the APK.

## FILE ANALYSIS

Something related to malware analysis is the domain malware check feature. Here, MobSF is extracting all the URLs/IP addresses that are hard-coded or being used in the application and shows its malware status as well as uses ip2location to give out its geolocation as well.

## DOMAIN MALWARE CHECK

Search:

| DOMAIN                        | STATUS | GEOLOCATION  |
|-------------------------------|--------|--|
| github.com                    | good   | <b>IP:</b> 13.234.176.102<br><b>Country:</b> India<br><b>Region:</b> Maharashtra<br><b>City:</b> Mumbai<br><b>Latitude:</b> 19.01441<br><b>Longitude:</b> 72.847939<br><b>View:</b> <a href="#">Google Map</a>                         |
| injuredandroid.firebaseio.com | good   | <b>IP:</b> 35.201.97.85<br><b>Country:</b> United States of America<br><b>Region:</b> Missouri<br><b>City:</b> Kansas City<br><b>Latitude:</b> 39.099731<br><b>Longitude:</b> -94.578568<br><b>View:</b> <a href="#">Google Map</a>    |
| m.do.co                       | good   | <b>IP:</b> 104.21.61.61<br><b>Country:</b> United States of America<br><b>Region:</b> California<br><b>City:</b> San Francisco<br><b>Latitude:</b> 37.7757<br><b>Longitude:</b> -122.395203<br><b>View:</b> <a href="#">Google Map</a> |
| schemas.android.com           | good   | No Geolocation information available.  |
| www.w3.org                    | good   | <b>IP:</b> 128.30.52.100<br><b>Country:</b> United States of America<br><b>Region:</b> Massachusetts   |

A comprehensive strings analysis is also available. People who are aware of malware analysis know about strings in-depth but for those of you who don't, strings are ASCII and Unicode-printable sequences of characters embedded within a file. Extracting strings can give clues about the program functionality and indicators associated with a suspect binary. For example, if an APK shows something as an output so that stream would be called and hence shown in the strings. This is not the same as strings.xml file. Many times, a third party IP address with which APK is communicating gets visible here. This is essential from a malware analysis point of view.

```

One can also find hardcoded emails in MobSF. This is all done using the decompiled source code. Often a pentester can find critical email IDs that were being used as a credential on a third party site, say, to access the database.

## EMAILS

Search:

| EMAIL   | FILE                                      |

Just like emails, URLs are often found hardcoded as well. One can find juicy URLs that are being used sometimes. Oftentimes analysts find malicious URLs being accessed as well or even a C&C server.

## URLS

Search:

| URL   | FILE                                      |

## Hardcoded secrets

Oftentimes developers have this habit of storing critical keys like AWS ID and credentials in strings.xml and use an object as a reference in java activity. But doing this doesn't help in any which way since strings.xml can be decoded easily.

### POSSIBLE HARDCODED SECRETS

```
"AWS_ID" : "AKIAZ36DGKTUIOLDOBN6"  
"AWS_SECRET" : "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"  
"enter_password" : "Enter password"  
"firebase_database_url" : "https://injuredandroid.firebaseio.com"  
"flag_eight_aws" : "flag eight - aws"  
"flag_nine_firebase" : "flag nine - Firebase"  
"google_api_key" : "AlzaSyCUImEIOSvqAswLqFak75xhskkB6illd7A"  
"google_crash_reporting_api_key" : "AlzaSyCUImEIOSvqAswLqFak75xhskkB6illd7A"
```

## Activity Components Present

A list of all the activities present can also be scrolled using MobSF. This gives an insight into the skeleton of the android APK. Also sometimes jadx replaces the real names of the class with some random letter if the developer has applied obfuscation, MobSF can associate its real name too (doesn't happen all the time or in cases of strong obfuscation).

## **📁 ACTIVITIES**

b3nac.injuredandroid.FlagSeventeenActivity  
b3nac.injuredandroid.CSPBypassActivity

## Dynamic Analyzer

For dynamic analysis, we'd need to fire up android VM in genymotion first. Here I've created an android VM on version 7.1

When you press the dynamic analyser option present on the top navigation pane, MobSF will automatically attach itself to VM running if MobSF and genymotion are running on the same base machine. However, if MobSF is in another virtual machine, you might have to attach MobSF agent to genymotion's VM's remote IP and port. Once it is attached, we see the following screen.

Dynamic Analyzer - b3nac.injuredandroid

☐ Capture String Comparisons  
☐ Enumerate Class methods

java.io.File

Frida Code Editor

```
1 Java.perform(1
2 // Use send(1
3 });
4
```

Under the analyzer status bar we can see various default frida scripts available that would check various basic vulnerabilities like SSL Pinning bypass and Root detection checks. If you haven't read about frida, please do so by going [here](#). There are other auxiliary scripts as well that lets an analyst enumerate various classes and also capture string comparisons in real time (again helpful for malware analysts point of view). Then simply click on start instrumentation and the selected scripts will be attached to the application automatically. Hence, if I have selected SSL Pinning bypass script and traffic is getting captured (visible in log or API monitor later) that would mean SSL Pinning has got bypassed.

Similarly, if one doesn't have to make do with pre-configured Frida scripts, it is also possible that Frida script be pasted in the text box on the right. There is also a dropdown box that would load those scripts. You can also edit the same.

```

## Logcat Stream

Logcat can also be viewed in MobSF's native environment. There's a button at the top menu that lets one view this.

## API Monitor

Just like logcat monitors device logs, APIs can also be monitored. APKs use various APIs in real-time to perform various functions, for example, the Base64 library.

## API Monitor - b3nac.injuredandroid

Data refreshed in every 10 seconds.

Data Snip:

Search:

## Downloading Reports

Once you have done the analysis, it is possible to download the report by sliding the menu bar slider on the left-hand side and click generate the report.

You might notice some errors while generating reports. To resolve this, you can follow the below command and install **wkhtmltopdf** module:

```
apt-get install wkhtmltopdf
```

```
root@hex:/home/hex# apt-get install wkhtmltopdf   
Reading package lists... Done  
Building dependency tree  
Reading state information... Done  
The following NEW packages will be installed:  
  wkhtmltopdf  
0 upgraded, 1 newly installed, 0 to remove and 0 not upgraded.  
Need to get 203 kB of archives.  
After this operation, 1,111 kB of additional disk space will be used.  
Get:1 http://in.archive.ubuntu.com/ubuntu focal/universe amd64 wkhtmltopdf amd64  
      build1 [203 kB]  
Fetched 203 kB in 1s (232 kB/s)  
Selecting previously unselected package wkhtmltopdf.  
(Reading database ... 462931 files and directories currently installed.)  
Preparing to unpack .../wkhtmltopdf_0.12.5-1build1_amd64.deb ...  
Unpacking wkhtmltopdf (0.12.5-1build1) ...  
Setting up wkhtmltopdf (0.12.5-1build1) ...  
Processing triggers for man-db (2.9.1-1) ...  
root@hex:/home/hex# █
```

Now, once again if you click on a recent scan bar, you'll see static and dynamic report generation options.

## Conclusion

MobSF is a great tool for the conduction of automated analysis on android APKs. It doesn't cover analysis of all the vulnerabilities and many tests can only be conducted manually but it is a nifty little tool that helps analysts up to a great extent. Thanks for reading.
